

Detection and evolution of repetitive proteins

Aleix Lafita

Bateman Research Group

EMBL-EBI Webinar

27th June 2017

Outline

1. Why should we care about protein repeats?
 2. Detection of protein repeats
 3. Duplication patterns and evolution
- Example protein throughout the webinar

What can you say about this protein sequence?

How frequent are tandem repeats in proteins?

Functional relevance of protein tandem repeats

- Binding specificity
 - Transcription factors
 - Protein-protein interactions

Tandem protein repeats provide an adaptation advantage

Staphylococcus aureus (GBS) cell surface

~ number of tandem domain repeats

Domain of Unknown Function 1220

EXAMPLE

DUF1220

From Wikipedia, the free encyclopedia

DUF1220 is a [protein domain](#) that shows a striking human lineage-specific (HLS) increase in copy number and may be important to human brain evolution.^[1] The DUF1220 domain name has recently been changed to the Olduvai domain based on data obtained since initial discovery of the domain.^[2] The copy number of DUF1220 domains increases generally as a function of a species evolutionary proximity to humans. DUF1220 copy number is highest in human (~289, with some person-to-person variations).^[3] and shows the largest HLS increase in copy number (an additional 160 copies) of any protein coding region in the human genome. DUF1220 copy number is reduced in African great apes (estimated 125 copies in [chimpanzees](#)), further reduced in orangutan (92) and Old World monkeys (35), single- or low-copy in non-primate mammals and absent in non-mammals.^[3] DUF1220 domains are approximately 65 [amino acids](#) in length and are encoded by a two-exon doublet. In the human genome DUF1220 sequences are located primarily on [chromosome 1](#) in region 1q21.1-q21.2, with several copies also found at 1p36, 1p13.3, and 1p12. Sequences encoding DUF1220 domains show rhythmicity, resonance^[4] and signs of positive selection, especially in primates, and are expressed in several human tissues including brain, where their expression is restricted to neurons.^[1]

Summary

- Tandem repeats are important for protein function and evolution.
- Tools for repeat detection and visualization.
- Evolutionary events can be inferred from sequence similarity patterns.
- Identify recurring protein repeat units.
